

Improving Battery Safety and Process Control with High-Speed X-ray Micro-CT

Dr. Till Dreier
Dr. Simona Laza

Battery Tech Expo Gothenburg
10th October 2024

A decorative graphic consisting of numerous thin, light blue lines radiating from a central point on the right side of the slide, creating a sunburst or starburst effect.

excillum

Outline

- Excillum introduction
- Potential of battery CT
- High-speed battery CT with MetalJet E1+
- Process control with full battery CT
- Battery research with nano-CT
- Collaborations and partnerships
- Demo capability

The source for X-ray innovation

Entirely devoted to advanced microfocus and nanofocus X-ray sources

... (and some pure e-beam sources)

Based in Stockholm, Sweden

Established 2007

80+ colleagues

55% in R&D

>10 nationalities

Our technology and product lines

MetalJet

World's brightest microfocuss X-ray source

Liquid metal-jet anode and advanced electron beam technologies

NanoTube

World's smallest X-ray nanospot

Advanced electron beam technology

Higher inspection speed

Brightness

Higher resolution

Analytical X-ray OEM partners

- our main business since 2011

X-ray sources for our partners' state-of-the-art analytical systems typically using SCD, SAXS or HAXPES methods in biology, chemistry & material sciences, and high-tech manufacturing quality assurance.

X-ray imaging OEM partners

- a growing business since 2020

X-ray sources for our partners' high-speed extreme-resolution radiography, computed tomography (CT) or phase-contrast imaging systems for use in research and high-tech manufacturing quality assurance.

Presented at JASIS 2024

Custom experimental systems

- our original business, and the most advanced users

We support researchers who build their own experimental systems based on our X-ray source, and work with partners if they require help to design and build custom systems.

Multi-modal microscope
 Würzburg University /
 Fraunhofer Institute
 Germany

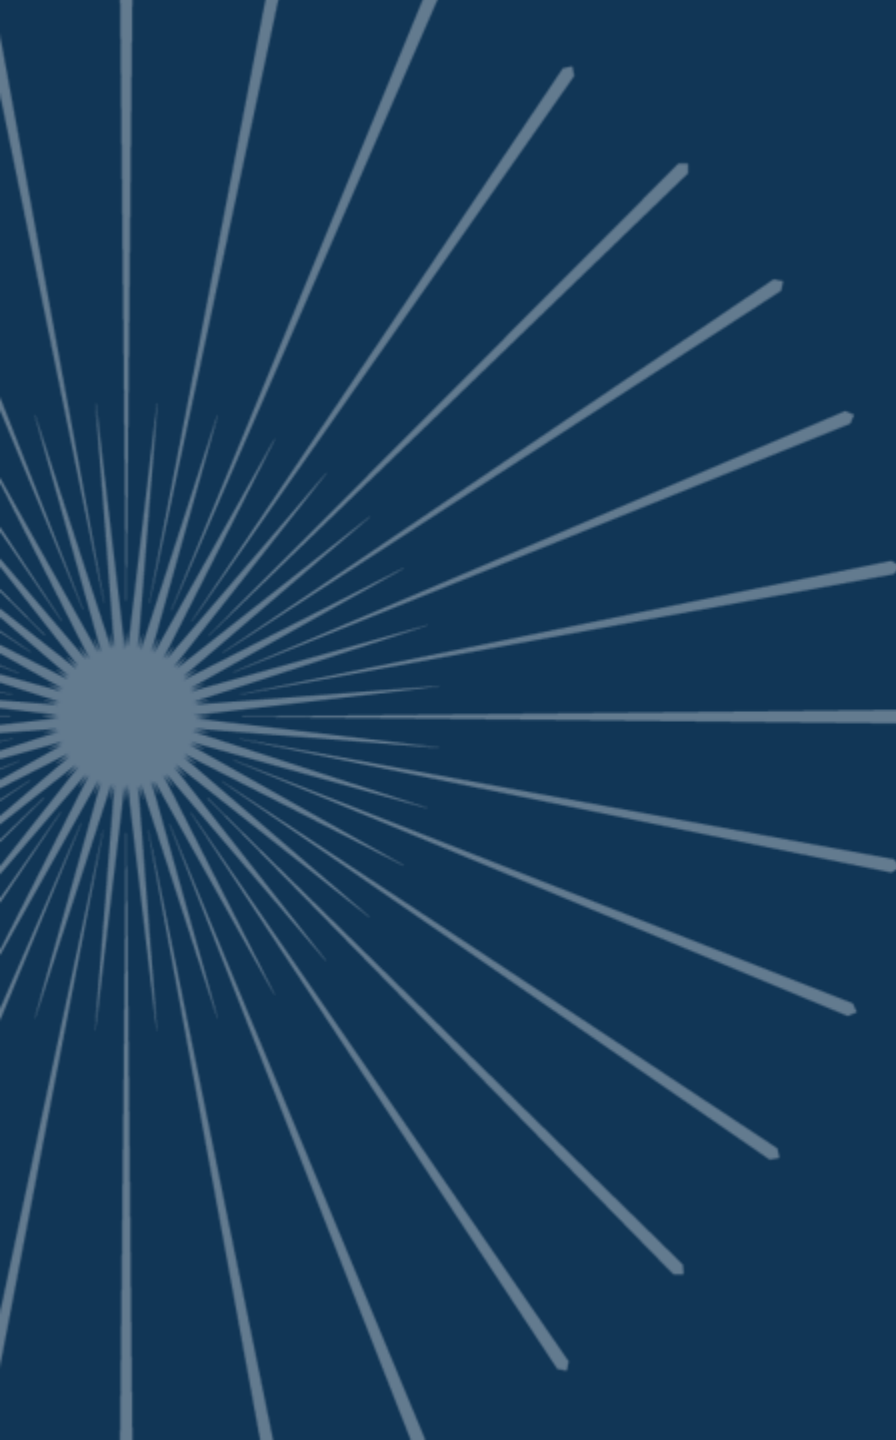

X-ray emission spectroscopy system
 Max Planck Institute
 Germany

SAXS system
 National Institute of
 Standards (NIST)
 USA

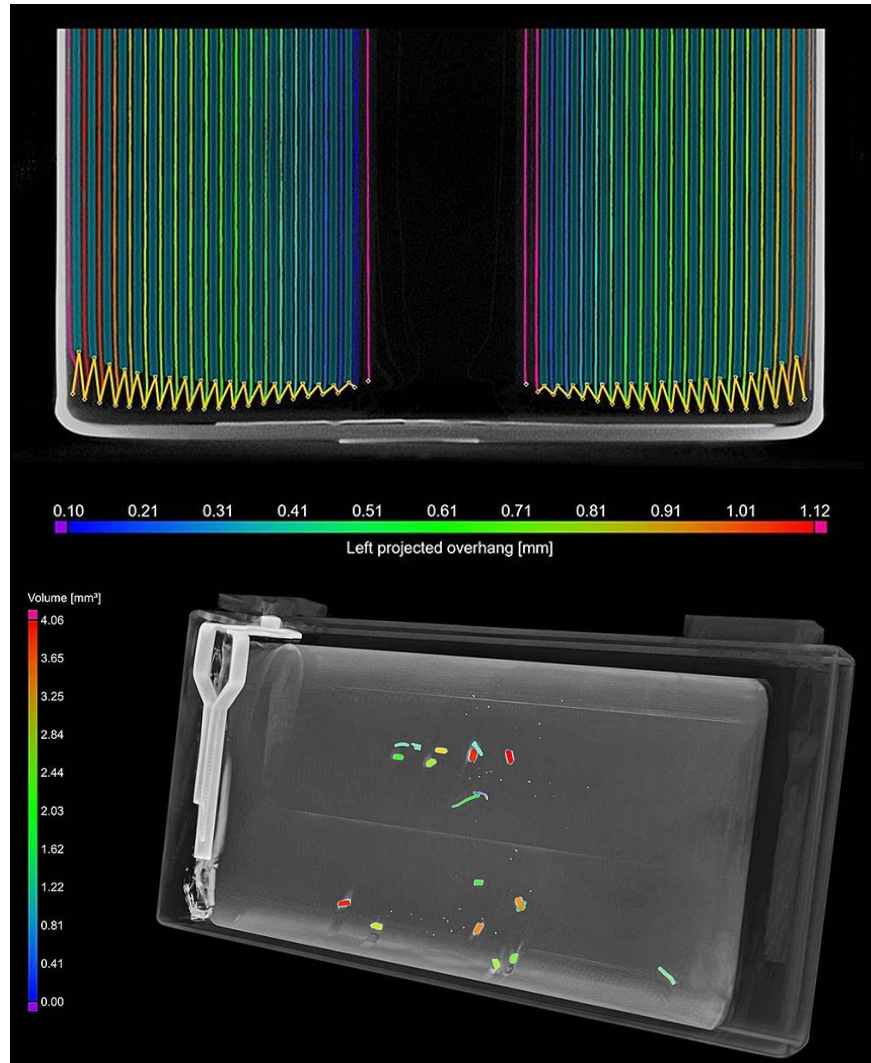

Phase-contrast imaging system
 Custom system by Proto
 Johns Hopkins university
 USA

Potential of battery CT

Potential of battery CT

TEST & INSPECTION

Test & Inspection

How CT Quality Analysis of EV Batteries Can Help Address Demand and Performance

Higher volumes of new batteries and faster turnaround of recycled materials from those batteries—along with testing of used and repurposed ones—demand the most efficient quality-inspection approaches possible.

Battery defects

Open-circuit defects

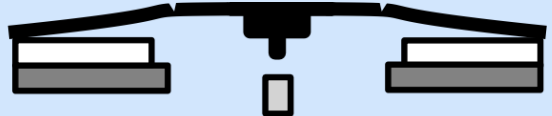

Tab weld failure

Tab tear

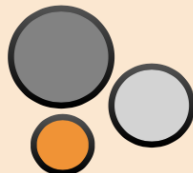

Terminal corrosion

Premature activation of protection device

Short-circuit defects

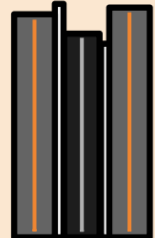

Direct short

Metallic particle contaminants

Metallic burrs and tears from tabs and foil

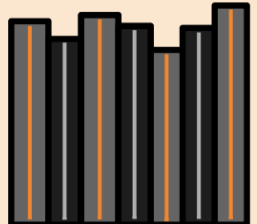

Missing/insufficient separator overhang

Hole/local weak spot in separator

Plating-induced short

Insufficient anode overhang

Missing/underloaded anode coating

Overloaded cathode coating

Electrode wrinkle

Electrode buckle

Sharp electrode curvature

2D imaging vs CT scanning

Conventional 2D inspection

Inspection with corner X-ray image

2D inspection image of corner

Due to the limitations of 2D X-ray, automatic inspection will not generate reliable data.

High-speed 3D inspection

Inspection of cross-sectional images in X and Y direction

Y-slice CT inspection image
Anode/cathode overhang detection

X-slice CT inspection image
Anode/cathode misalignment detection

CT-inspection generates 3D volume data for automatic inspection with maximum reliability.

CT scanning of batteries

Contrast = radiodensity \sim atomic number
CT is readily interpretable

Defects identified by CT

Jellyroll buckling

**Performance degradation
Electrode shorting**

Negative radial overhang

**Lithium plating
(shorting)**

Negative axial overhang

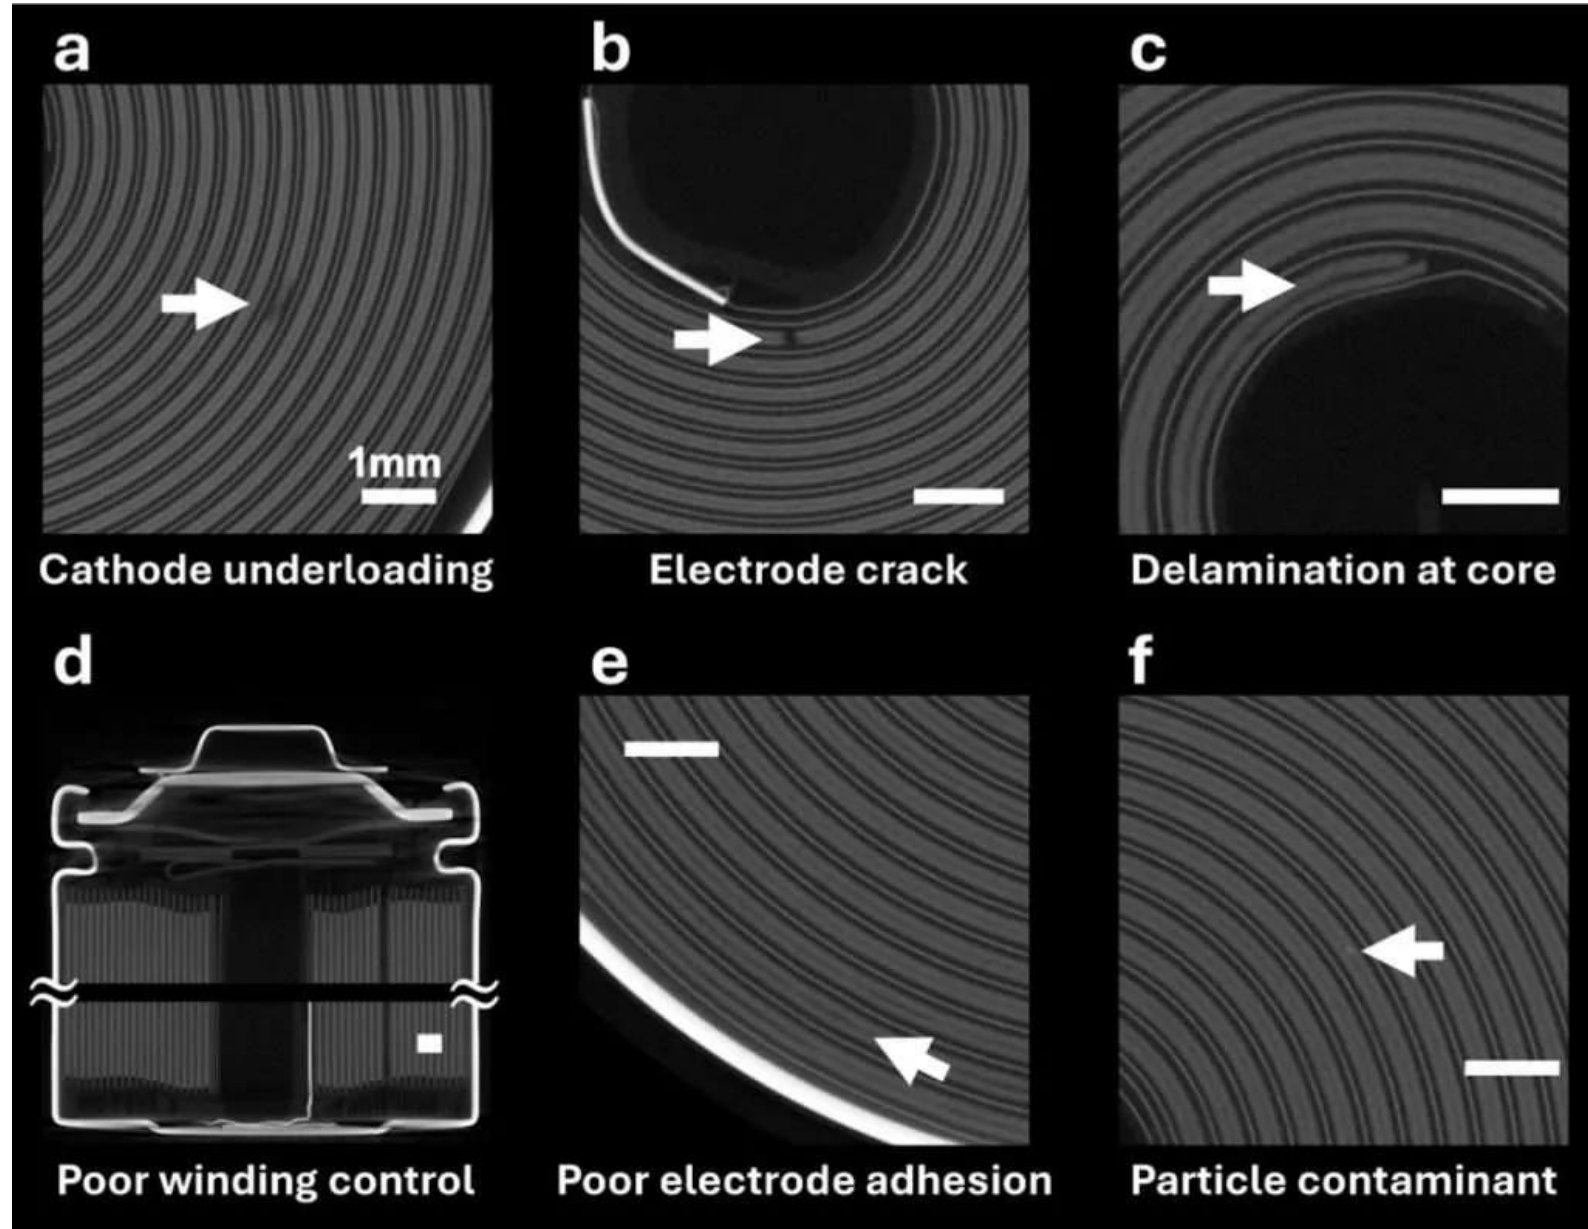

**Lithium plating
(shorting)**

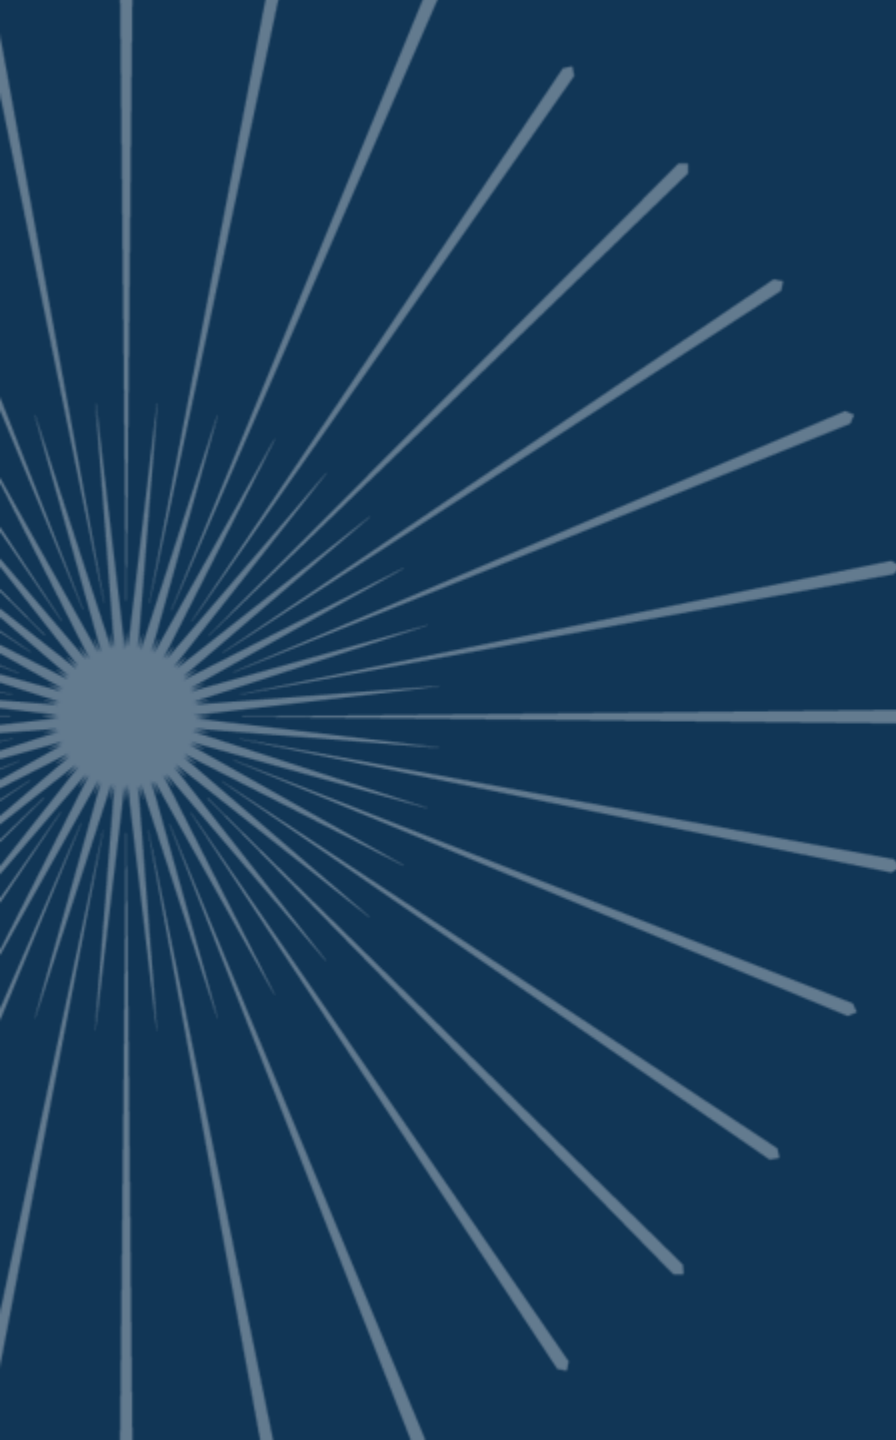

Housing damage

**Electrolyte leaking
Moisture infiltration**

Defects identified by CT

Excillum MetalJet E1+ for battery safety

The world's brightest micro-focus X-ray source

1s CT using a Direct Conversion DualThor CdTe detector at 2000 fps:
<https://www.youtube.com/watch?v=pagg9oxkzsU>

High-speed battery CT

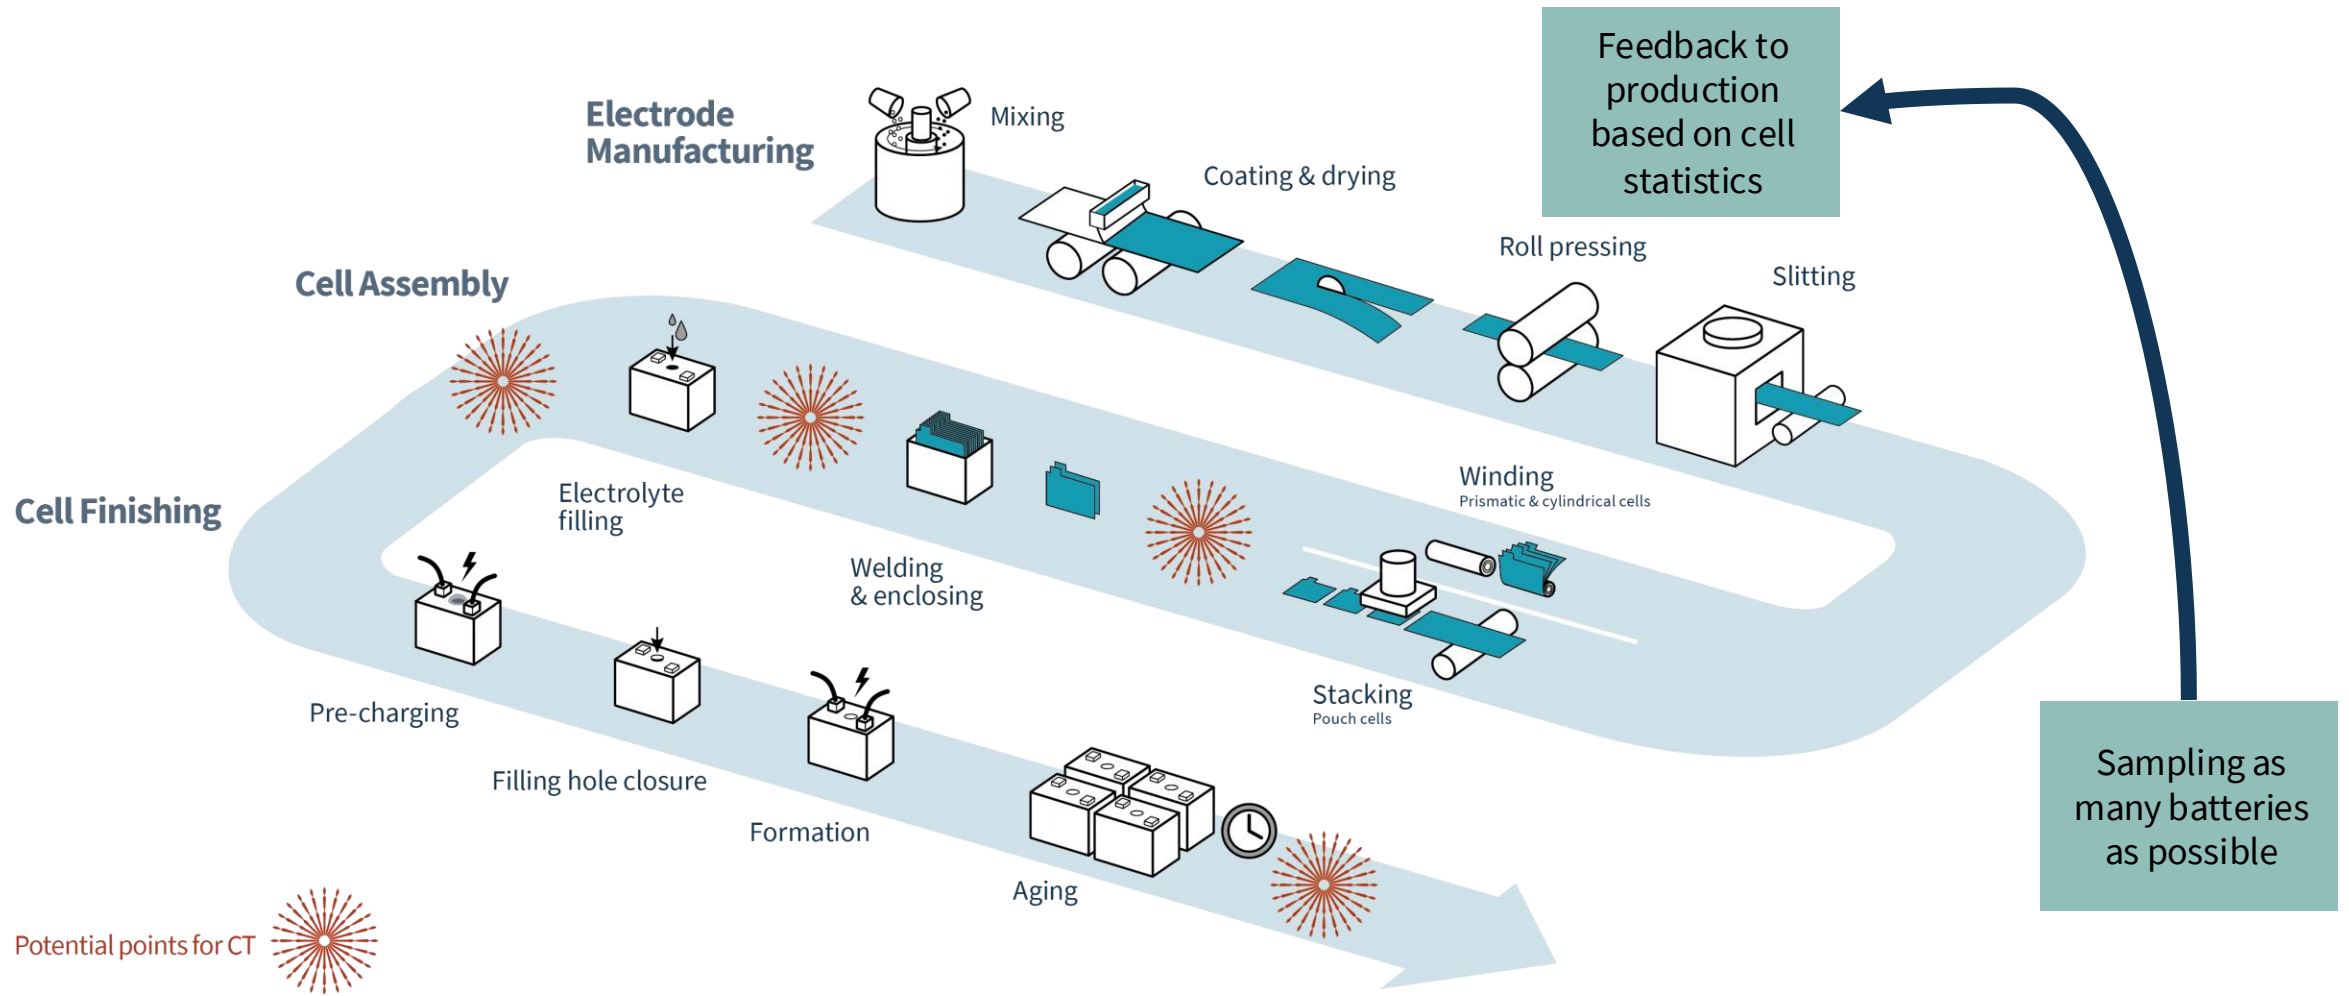

- Overhang CT
 - Down to 0.5 s scan time
- Cylindrical cells
 - < 15 s helical-CT of 4680 cells
 - Overhang analysis
 - Particle detection
 - Layer defects
 - Winding defects
 - etc ...

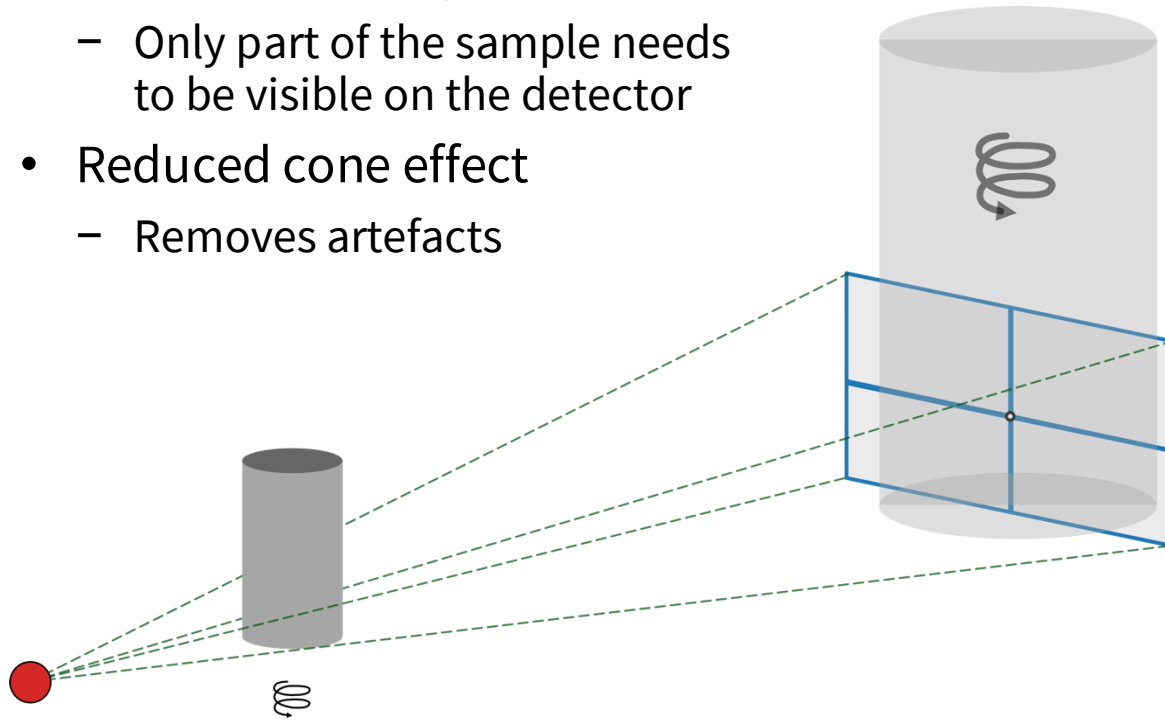

Process control

Process control through at-line full cell scanning

Helical CT

- Spiral motion instead of circular motion
- Allows more magnification
 - Only part of the sample needs to be visible on the detector
- Reduced cone effect
 - Removes artefacts

Single projection image

Reconstruction (upper part only)

X-ray nano-CT for battery research

Nano-CT of a battery cathode

Nano-CT of a battery cathode

Imaging of anode and cathode layers

Battery cathode - mostly Cobalt (50 μm per side) with an Aluminium collector in the middle (10 μm).

Battery anode - mostly Graphite (50 μm per side) with a Copper collector in the middle (10 μm).

Cathode layer
LiCoO₂
~50 μm

Aluminum
collector
~10 μm

Particle radius

Sphericity

Volume

Excillum's Collaboration Interests

Member of European Industry Associations

Member of Swedish Competence Centers

Excillum reinvest 25% of its sales in R&I.

Collaborative interests:

- Technology development and new market access
- Participation in Pilot lines
- Collaborative projects: *Horizon Europe, Eurostars, Chips JU, VINNOVA, Enerngymindigheten, etc.*
- Commercial collaborations

Contact us for a demo

- Nano-CT setup with NanoTube N3 160 kV

- Micro-CT with MetalJet E1+ 160 kV
